by Anupama r.k, Queenie Tsang, Crystal (Yunan) Zhu

21/02/2021

To do list:

- Add Pie charts! - by sub__category, region # (done)
- Create a Month variable - to see the change of sales/profits by month?
- bar charts of profits/sales by region #(done)
- Output the characteristics of the orders with the highest and lowest profits/sales - e.g. what made the order? when? bought what product? in which city/state/region? Any discount?
- relationship between discount & sales, discount & profits, sales & profits, and the role of region?
- from someone's analysis - there is no significant change between the four discount categories when it comes to Sales
- sales/profits by month, rather than by date? color by region?

Abstract

Anomaly detection or Outlier detection identifies data points, events or observations that deviate from dataset's normal behavior. Anomalous data indicate critical incidents or potential opportunities. In order to take advantage of opportunities or fix costly problems anomaly detection has to be done in real time. Unsupervised machine learning models can be used to automate anomaly detection. Unsupervised anomaly detection algorithms scores data based on intrinsic properties of the dataset. Distances and densities are used to give an estimation what is normal and what is an outlier. Anomaly detection monitor is a tool developed for an online retailer to check product quality issues like profit opportunities and sales glitches. The application is built using R and Shinyapp following CRISP-DM framework.

Business Case

Objective

Detect point anomalies from superstore dataset using K-NN and clustering methods

Data Understanding

US Superstore dataset is sourced from US uperstore dataset . The dataset have online orders for Superstores in U.S. from 2014-2018. Tableau community is the owner of the dataset. The dataset has 9994 records and 21 attributes.

Import data

```
superstore<- read_excel("US_Superstore_data.xls")

look at the time range for these transactions, ie. start date for Order_Date column:

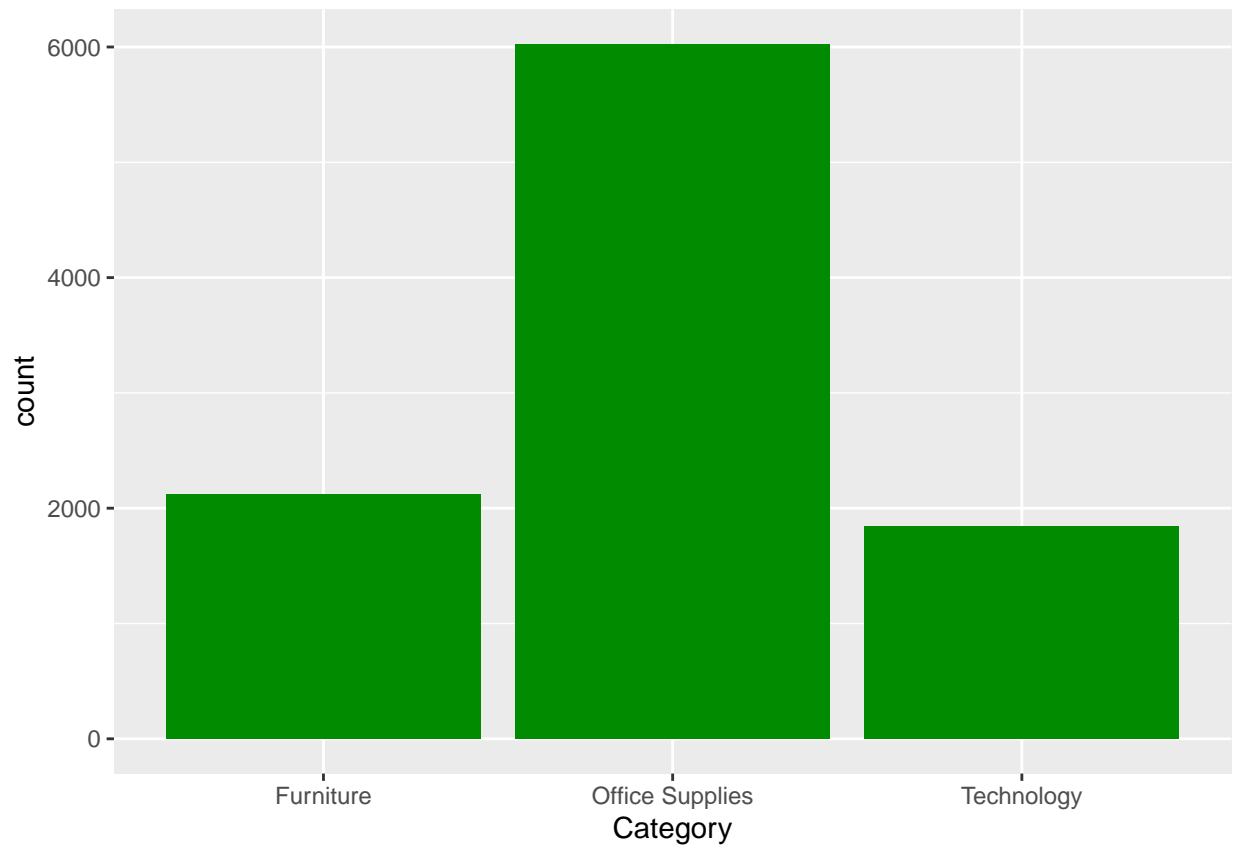

```
summary(data$Order_Date)

```

```
#[1] min "2014-01-03", max "2017-12-30"

Basically this dataset covers transactions ranging from 2014-01-03 to 2017-12-30.

```
ggplot(data = data) +  
  geom_bar(mapping = aes(x = Category), fill="green4")
```

Most type of products sold belong to the Office supplies category.

```
ggplot(data = data) +  
  geom_bar(mapping = aes(y = 'Sub_Category', fill="green4"))
```

```
ggplot(data = data, mapping = aes(x = Sales)) +
  xlim(0, 5000) +
  geom_histogram(binwidth = 5, fill="green4")
```

Most sales are very few items (<500).

```
ggplot(data = data, mapping = aes(x = Quantity)) +  
  geom_histogram(binwidth = 0.5, fill = "green4")
```

```
ggplot(data = data) +

Sales transactions mostly do not involve discounts.

Visualise sales transactions by Region over time (order date).

```
ggplot(data, aes(Order_Date, Sales,color=Region)) +  
  geom_line()
```

Let's zoom in a little bit - Visualise sales transactions by Region over time (order date).

```

It looks like some categories of items ie. supplies or accessories have negative sales values.

How does sales vary across sub category?

ggplot(data = data, mapping = aes(x = Sales, y = 'Sub_Category' )) +  
  geom_boxplot()

Look at relationship between numeric variables:

```
#subset the numeric variables:
numeric_vars<- c("Sales", "Quantity", "Discount", "Profit", "diff_in_days")
num_data <- data[numeric_vars]
```

We'll use a correlation matrix to look at the relationship between numeric variables:

```
cor(num_data)

Discount is negatively correlated with profit, whereas sales is positively correlated with profit. The time between order date and ship date (diff_in_days) is not correlated with sales, quantity, discount, or profit.

Data Preparation

```
#make a copy of the original dataset and copy to data1
data1 <- data
```

drop column Row ID because it is not necessary; it is the row number from the original excel file. The country variable is also not needed because all the values are United states. Customer_Name and Customer_ID give redundant information. So we will drop the Customer_Name column and keep only the Customer_ID column.

```
data1[,c("Row_ID", "i__Row_ID", "Country", "Customer_Name")]<-NULL
```

```
head(data1)

For this K-means clustering we will use the numeric variabls only: which are sales, quantity, discount, profit, diff_in_days (columns 15 - 19). K means clustering is affected by the starting assignment points, so we will try with 25 different starting assignments (nstart = 25), and see which ones work the best.

```
#Compute K-means clustering with k=3 (3 initial distinct cluster centres)
set.seed(123)

results_kmeans <- kmeans(scale(data1[, (15:19)]), 3, nstart =25)

#kmeans clusters to show the group of the individuals
results_kmeans$cluster

Plot K-means

The factoextra package contains a function called `fviz_cluster()` which can be used to visualize kmeans clusters. The input required is the original dataset, and the kmeans results. These are used to produce plots which show points that represent observations.

```
fviz_cluster(results_kmeans, data = data1[, (15:19)],
  palette = c("#2E9FDF", "#E495A5", "#E7B800"),
  geom = "point",
  ellipse.type = "convex",
  ggtheme = theme_bw()
)
```

Reduce dimensions using Principal Component Analysis.

```
results_pca <- prcomp(data1[, (15:19)], scale=TRUE)

#Coordinates of individual observations
indiv_coordinates <- as.data.frame(get_pca_ind(results_pca)$coord)
```

```

#Add clusters obtained through the Kmeans algorithm
indiv_coordinates$cluster <- factor(results_kmeans$cluster)

#Add region from the dataset
indiv_coordinates$Region <- data1$Region

#look at the first few rows of individual coordinates
head(indiv_coordinates)

```

```

#To visualize the k-means clusters:

```

ggscatter(
  indiv_coordinates, x = "Dim.1", y = "Dim.2",
  color = "cluster", palette = "npg", ellipse = TRUE, ellipse.type = "convex",    #adding the concentra
  shape = "Region", size = 1.5, legend = "right", ggtheme = theme_bw(),
  xlab = paste0("Dim 1 (", variance.percent[1], "% )" ),
  ylab = paste0("Dim 2 (", variance.percent[2], "% )" )
) +
  stat_mean(aes(color = cluster), size = 4)    #stat_mean is used for adding the cluster centroid

```

The clustering plot shows that the groups are very close together, and overlap slightly. The clusters could be further apart with some tuning.
